disseminated intravascular coagulation (DIC), burns, transplantations, thalassaemia, sickle cell disease, viral haemorrhagic fever and haemolytic uremic syndrome; sepsis in combination with bacterial permeability increasing protein; thrombotic disorders in combination with an anti-platelet agent; protein C deficiency; acute arterial thrombotic occlusion, thromboembolism or stenosis in coronary, cerebral or peripheral arteries or in vascular grafts in combination with a thrombolytic agent. Nucleic acid molecules of the invention are useful for treating humans with genetically predisposed prothrombotic disorders by gene therapy. The present sequence is human protein C derivative.
                                                                                                                                                                                                                                                                                                                                                                                                           anticoagulation activity, resistance to serpin inactivation and increased sensitivity to thrombin activation compared to wild type protein C, and retains the biological activity of the wild type
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      substitutions at specified amino acid positions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      protein C derivative for treating acute coronary syndromes, vascular occlusive disorders, thrombotic disorders and sepsis, comprises substitutions at specified amino acid positions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  N-PSDB; AAD15226
                                                                                                                                                                                                                                                                                                                               protein C. Protein C derivatives are useful in the manufacture of a medicament for the treatment of acute coronary syndromes e.g. myocardial infarction and unstable angine; and disease states predisposing to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to human protein C derivatives and nucleic acid molecules encoding such derivatives. These derivatives have increased
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 4;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WPI; 2001-514662/56

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to human protein C derivatives and nucleic acid molecules encoding such derivatives. These derivatives have increased anticoagulation activity, resistance to serpin inactivation and increased sensitivity to thrombin activation compared to wild type increased sensitivity to thrombin activation compared to wild type protein C, and retains the biological activity of the wild type human protein C and retains the biological activity of the wild type human protein C. Protein C derivatives are useful in the manufacture of a medicament for the treatment of acute coronary syndromes e.g. myocardial infarction and unstable angina; and disease states predisposing to thrombosis; vascular occlusive disorders and hypercoagulable states e.g. disseminated intravascular coagulation (DIC), burns, transplantations, thalassaemia, sickle cell disease, viral haemorrhagic fever and haemolytic uremic syndrome; sepsis in combination with bacterial permeability increasing protein; thrombotic disorders in combination with an anti-platelet agent; protein C deficiency; acute arterial thrombotytic agent. Nucleic acid molecules of the invention are useful for treating humans with genetically prodisposed prothombotic disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                 This sequence represents a modified GLA (gamma-carboxyglutamic acid) domain. The invention relates to a vitamin K-dependent polypeptide comprising a modified GLA domain containing an amino acid substitution which enhances membrane binding of the modified polypeptide as compared to the native polypeptide. The polypeptide is used to treat a clotting disorder by decreasing or increasing clot formation. Modification of the GLA domain results in a protein which has enhanced membrane binding affinity as compared to the native protein.
                                                                                                                                                                                                                                                                 WPI;

                                                                                                                                                                                                                                              This sequence represents a modified GLA (gamma-carboxyglutamic acid) domain. The invention relates to a vitamin K-dependent polypeptide comprising a modified GLA domain containing an amino acid substitution which enhances membrane binding of the modified polypeptide as compared to the native polypeptide. The polypeptide is used to treat a clotting disorder by decreasing or increasing clot formation. Modification of the GLA domain results in a protein which has enhanced membrane binding affinity as compared to the native protein.

The invention relates to a vitamin K-dependent polypeptide comprising a modified GLA domain containing an amino acid substitution which enhances membrane binding of the modified polypeptide as compared to the native polypeptide. The polypeptide is used to treat a clotting disorder by decreasing or increasing clot formation. Modification of the GLA domain results in a protein which has enhanced membrane binding affinity as compared to the native protein.

CC protein C, and retains the biological activity of the wild type human CC protein C. Protein C derivatives are useful in the manufacture of a CC medicament for the treatment of acute coronary syndromes e.g. myocardial CC infarction and unstable angina; and disease states predisposing to CC thrombosis; vascular occlusive disorders and hypercoagulable states e.g. CC disseminated intravascular coagulation (DIC), burns, transplantations, CC thalassaemia, sickle cell disease, viral haemorrhagic fever and CC haemolytic uremic syndrome; sepsis in combination with bacterial CC permeability increasing protein; thrombotic disorders in combination CC with an anti-platelet agent, protein C deficiency; acute arterial CC or peripheral arteries or in vascular grafts in combination with a CC or peripheral arteries or in vascular grafts in combination with a CC or treating humans with genetically predisposed prothrombotic disorders CC by gene therapy. The present sequence is human protein C derivative.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

Human patients with genetically predisposed prothrombotic disorders may
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   sequence (see AAB2673) is substituted with Gin, Ser at position 11 with Gly, Gln at position 32 with Glu, Asn at position 33 with Asp, and Leu at position 194 with Ser. It is an example of protein C derivatives of the invention that have at least 2 amino acid substitutions, but which have increased anticoagulant activity and resistance to inactivation by serpins compared with the wild-type protein. A method of producing the biological activity of the wild-type protein. A method of producing the derivatives using recombinant DNA methods is claimed. The protein C derivatives are useful for

The present sequence is that of a claimed human protein C derivative in which His at position 10 of the wild-type protein C sequence (see AAB82673) is substituted with Gln, Ser at position 11 with Gly, Gln at position 32 with Glu, Asn at position 33 with Asp, Leu at position 194 with Ser, and Thr at position 254 with Ser. It is an example of protein C derivatives of the invention that have at least 2 amino aci substitutions, but which have increased anticoagulant activity and resistance to inactivation by serpins compared with the wild-type protein, while retaining the biological activity of the wild-type
                                                                                                          Claim
                                                                                                                                                                                                                                                                                                                                                             Modified-site

Human patients with genetically predisposed prothrombotic disorders may be treated by gene therapy (all claimed).
       This sequence is the protein C GLA (gamma-carboxyglutamic acid) domain. The invention relates to a vitamin K-dependent polypeptide comprising a modified GLA domain containing an amino acid substitution which enhances membrane binding of the modified polypeptide as compared to the native polypeptide. The polypeptide is used to treat a clotting disorder by decreasing or increasing clot formation. Modification of the GLA domain results in a protein which has enhanced membrane binding affinity as compared to the native protein.

                                                                                                                                                                                                                                                                                                           comprising a modified gamma-carboxy glutamic acid (GLA) domain having at least one amino acid substitution, that enhances membrane binding affinity and the activity of the polypeptide relative to a corresponding native vitamin K-dependent polypeptide and inhibits clot formation.

(I) can have thrombolytic and haemostatic activities, and can be used as an inhibitor of clot formation. (I) is useful for decreasing clot formation in a mammal, a factor VII or factor IX containing a modified GLA domain is useful for increasing clot formation and for treating a location of the superior containing a modified service of the superior containing a sup
                                                                                                                                                                                                         bleeding disorder, including thrombosis and clotting disorders such as haemophilia B, haemophilia B and liver disease. The present sequence represents a human protein C GLA domain sequence, given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Example 5; Page 42; 81pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel vitamin K-dependent polypeptide useful for treating clotting disorders such as thrombosis and hemophilia, comprises modified gamma-carboxy glutamic acid domain that enhances membrane binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Nelsestuen

Protein C chimeric proteins for use as anticoagulants - having gamma carboxyglutamic acid region replaced with Vitamin K dependent clotting factor e.g. prothrombin

Page 15; 42pp; English.

The present sequence represents the first three exons of the human protein C protein, which contains gamma carboxylgiutamic acid modified residues. This sequence was replaced with the corresponding regions of modified human prothrombin (AAW75709), to create a protein C prothrombin Gla domain chimera. To produce this chimera, the wild type protein C cDNA was ligated into processed with restriction enzymes to remove the first three exons and the first codon of exon four. The prothrombin CDNA was amplified, digested, and then ligated into RSV-PC at the identical site where the protein C CDNA exons ligated into RSV-PC at the identical site where the protein C cDNA exons and been removed. This construct was then transfected into human from which the chimeric protein can be purified.

chimeric protein can be used as a anticoagulant, to treat disorders where protein S is low, some forms of lupus, following stroke or myocardial infarction, after venous thrombosis and in disseminated intravascular coagulation, adult respiratory distress syndrome, in thromboembolic disease or factor V Leiden.

    Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

FUNCTION: PROTEIN C IS A VITAMIN K-DEPENDENT SERINE PROTEASE THAT

REGULATES BLOOD COAGULATION BY INACTIVATING FACTORS VA AND VIIIA

IN THE PRESENCE OF CALCIUM IONS AND PHOSPHOLIPIDS.

CATALYTIC ACTIVITY: Degradation of blood coagulation factors Va

TISSUE SPECIFICITY: Plasma; synthesized in the liver.
PTM: The vitamin K-dependent, enzymatic carboxylation of s
residues allows the modified protein to bind calcium.
MISCELLANEOUS: Calcium also binds, with stronger affinity
another site, beyond the GLA domain. This GLA-independent
